Serotype 14 variants of the Spanish penicillin-resistant serotype
9V clone of Streptococcus pneumoniae arose by large recombinational
replacements of the cpsA-pbpla region
Microbiology 145 (Pt 8), 2023-2031 (1999)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note="Uruguayan variant of the major penicillin-resistant

Serotype 14 variants of the Spanish penicillin-resistant serotype
Serotype 14 variants of the Spanish penicillin-resistant serotype
V clone of Streptococcus pneumoniae arose by large recombinational
replacements of the cpsA-pbpla region
Microbiology 145 (1999) In press
2 (bases 1 to 2160)

                                                                                                                                                                                                                                                                                                                                                                                                                        are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a protein from Streptococcus pneumoniae. The nucleic acid sequence encoding the Streptococcus pneumoniae protect can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection enpneumonia, otitis media or meningitis, probes based on the nucleic ac

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1920
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1860
```

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV22134 to AAV52524) recorded on it, or a representative fragment or a sequence at least identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted SEQ ID NO:1 to 391 (AAV52334 to AAV52524) are genomic fragments from SEQ ID NO:1 to 391 (AAV52334 to AAV52524) are genomic fragments from

95**8** 

SEQ ID NO:1 to 391 (AAV52134 t Streptococcus pneumoniae. The

nucleic

molecule

encoding

b

homologue

present invention also describes

CC fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the CC nucleic acid molecule is produced by a process comprising: (a) screening CC a genomic DNA library using as a probe a target sequence defined by any CC of the sequences in SEQ ID NO:1 to 391, identifying members of the CC isolating the nucleic acid molecules from the members; or (b) isolating CC mRNA, DNA or CDNA produced from an organism, amplifying nucleic acid CC molecules whose nucleotide sequence is homologous to amplification CC primers derived from the fragment of the S. pneumoniae genome to prime CC the amplification and isolating the amplified sequences. The computer CC readable medium can be used in a computer-based system for identifying CC from the present invention can be used in diagnosis kits and assays, and CC pharmaceutical compositions and vaccines for S. pneumoniae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                The present sequence encodes a soluble variant of the S. pneumoniae penicillin binding protein (PBP) 1A, which lacks the 1st 38 amino acid residues of the wild type protein. Wild type PBP is a bifunctional protein, which binds the cell membrane when expressed in a bacterial cell, having transplycosylase and transpeptidase activities. The variant protein (NCIMB 40665) in conjunction with a labelled anti-bifunctional PBP monoclonal antibody, can be used to identify and assay for cpds. which bind bifunctional PBP. Such cpds., as inhibitors of bifunctional PBP have a potential use in therapeutic cpds. which inhibit the growth of antibiotic resistant pacteria. The soluble variant may also be used in x-ray
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transglycosylase; transpeptidase; identification, antibiotic resistant; bacteria; soluble variant; X-ray crystallography; determination; ds.

The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes cand/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical especies with a combination of defined primer pairs. The method can be cused for producing probes and/or primers for detecting one or more cused for producing probes and/or primers for detecting one or more cused for producing probes and/or primers for detecting one or more cused for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal customatical species, genus, family and group. A nucleic acid (1) cobtained using the method of the invention can be used for the universal detection of at least one antimicrobial agent resistance gene or at cleast one toxin gene. hexA nucleic acids are used for the specific and cubiquitous detection and for identification of Streptococcus pneumoniae. (1) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., corynebacteriaceae family, Pseudomonads group, Streptococcus sp. (2) Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can company to the specific and couracy is also achieved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

                                                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential CC genes, themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The cinvention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used CC to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen CC for homologous nucleic acids which are required for cell proliferation in CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part of the printed encorification but the Obstained in alternation.
                                                                                                                                                                                                                                               Query Match

The present invention describes a method for generating a repertory of CC nucleic acids of tuf, fus, atpD and/or recA genes from which probes CC and/or primers are derived. The method comprises amplifying the nucleic cids of determined algal, archaeal, bacterial, fungal and parasitical CC species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more CC related microorganisms e.g. algae, archaea, bacterial, fungi and CC parasites, for universal detection and for specific and ubiquitous CC detection and identification of an algal, archaeal, bacterial, fungal CC and parasitical species, genus, family and group. A nucleic acid (I) CC obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the cleast one toxin gene. hexA nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against CC microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia addacens, Bordetella sp., CC corynebacteriaceae family, Pseudomonads group, Escherichia coli, CC Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests CC provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved.

CC AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
Sequence 1249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algarchaeal, bacterial, fungal and parasitical species in a test sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 27;

                                                                                                                                                                                                                                                                                                                                                                                                             A polymerase chain reaction (PCR) assays have been developed for CC detecting an antibiotic resistant strain of Streptococcus pneumoniae CC using primers based on the penicillin binding protein 2B (pbp2B) gene CC and the pbp1A gene. The products and methods can be used for detecting CC s. pneumoniae, particularly antibiotic-resistant strains. They can be used for simultaneously diagnosing pneumococcal meningits and identifying any antibiotic-resistant S. pneumoniae strains in a sample. The methods can be used for detecting S. pneumoniae strains resistant to antibiotics, e.g. beta-lactam antibiotics, preferably penicillin. The assays can be adapted to detect on the pathogens causing meningitis. The assays can be used to detect an antibiotic resistant strain of CC s. pneumoniae with a minimum inhibitory concentration (MIC) of 0.25-1 micro g/ml where the PCR products detected are a 1043 bp and Ca 224 bp product. The present sequence represents a Streptococcus pneumoniae pbp1A transpeptidase encoding region (TER) isolate nucleotide concentration.
                                                                                                                                                                                                                                                                                                                      Query Match
